

## PENTEGRA RETIREMENT SERVICES NEWS

April 2014

World-wide news has been covering the impact of the Heartbleed bug. In short, this bug can allow sensitive personal information (including usernames, passwords, emails, instant messages, credit card numbers, etc.) to be retrieved by unauthorized individuals by taking advantage of a bug in OpenSSL security software used by millions of websites around the world. The good news is that Pentegra does **NOT** use OpenSSL on our websites so we were never at risk from an outside attack. What this means is that our clients and participants do not have to change their Pentegra passwords, however we do encourage everyone to change their passwords periodically.
